

Java Server Pages

JSP Technology as a Presentation Mechanism

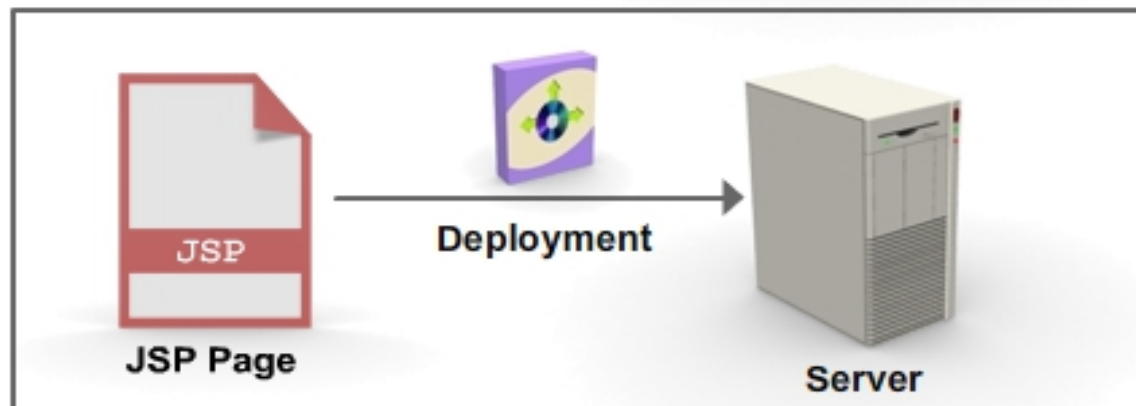

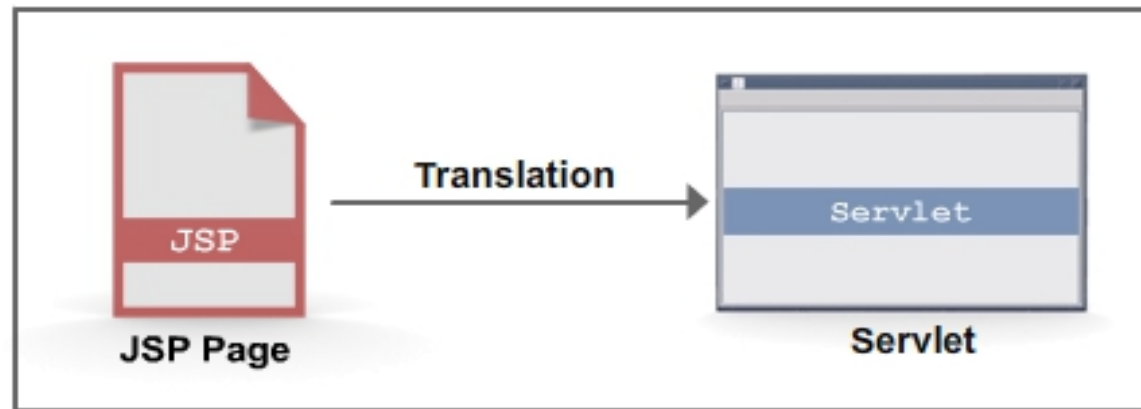

Support servlet objects:

request, response, pageContext, session, out, application, config, page, exception

Supported objects

- request,
- response,
- pageContext,
- session,
- out,
- application,
- config,
- page,
- exception

JSP Page Deployment Mechanism

Components of JavaServer Pages

- Directives - `<%@ директива %>`
 - page
 - include
 - taglib
- Declarations - `<%! объявление %>`
- Expressions - `<%= вычисляемое выражение %>`
- Scriptlets - `<% скриптлет %>`
- Comments - `<%-- JSP-комментарий --%>`
 - `<!-- comments ... -->`
 - `<%-- comment text --%>`
 - `<!-- comment text <%= expression %> more comment text ->`

```
<%@ page language="java" import="eMagazin.inventar.*" %>
```

Директива page

```
<HTML>
```

```
<!--
```

Наглядная страница,
которая содержит все JSP элементы.

Выходящий комментарий

```
--!>
```

```
<HEAD><TITLE>
```

Разбор JSP

```
</TITLE></HEAD>
```

Статический текст и HTML

Директива taglib

```
<BODY>
```

```
<%@ taglib uri="http://il8n.taglib/il8n-taglib" prefix="il8n" %>
```

```
<%--
```

Вставит стандартную шапку.

Скрытый комментарий

Директива include

```
--%>
```

```
<%@ include="shapka.html" %>
```

```
<jsp:useBean
```

id="klient" class="eMagazin.inventar.Klient" scope="session"

JSP действие

```
/>
```

```
<jsp:setProperty name="klient" property="" />
```

```
<il8n:string> Добро пожаловать </il8n:string>
```

Собственный знак

```
<%= klient.getName() %>
```

JSP выражение

```
<%!
```

private static final KORZINA = "korzina";

JSP объявление

```
%>
```

```
<%--
```

Получит каталог товаров
и актуальную корзину покупателя.

Скрытый комментарий

```
--%>
```

```
<%
```

request.setAttribute();

String ryadTovarov = request.getParameter();

Produkt[] katalog = Inventar.getKatalog(ryadTovarov);

if (korzina.full()) {

JSP скриплет

```
%>
```

```
<jps:forward page="spasibo za pokupku.jsp" />
```

JSP действие

```
<% ) %>
```

JSP скриплет

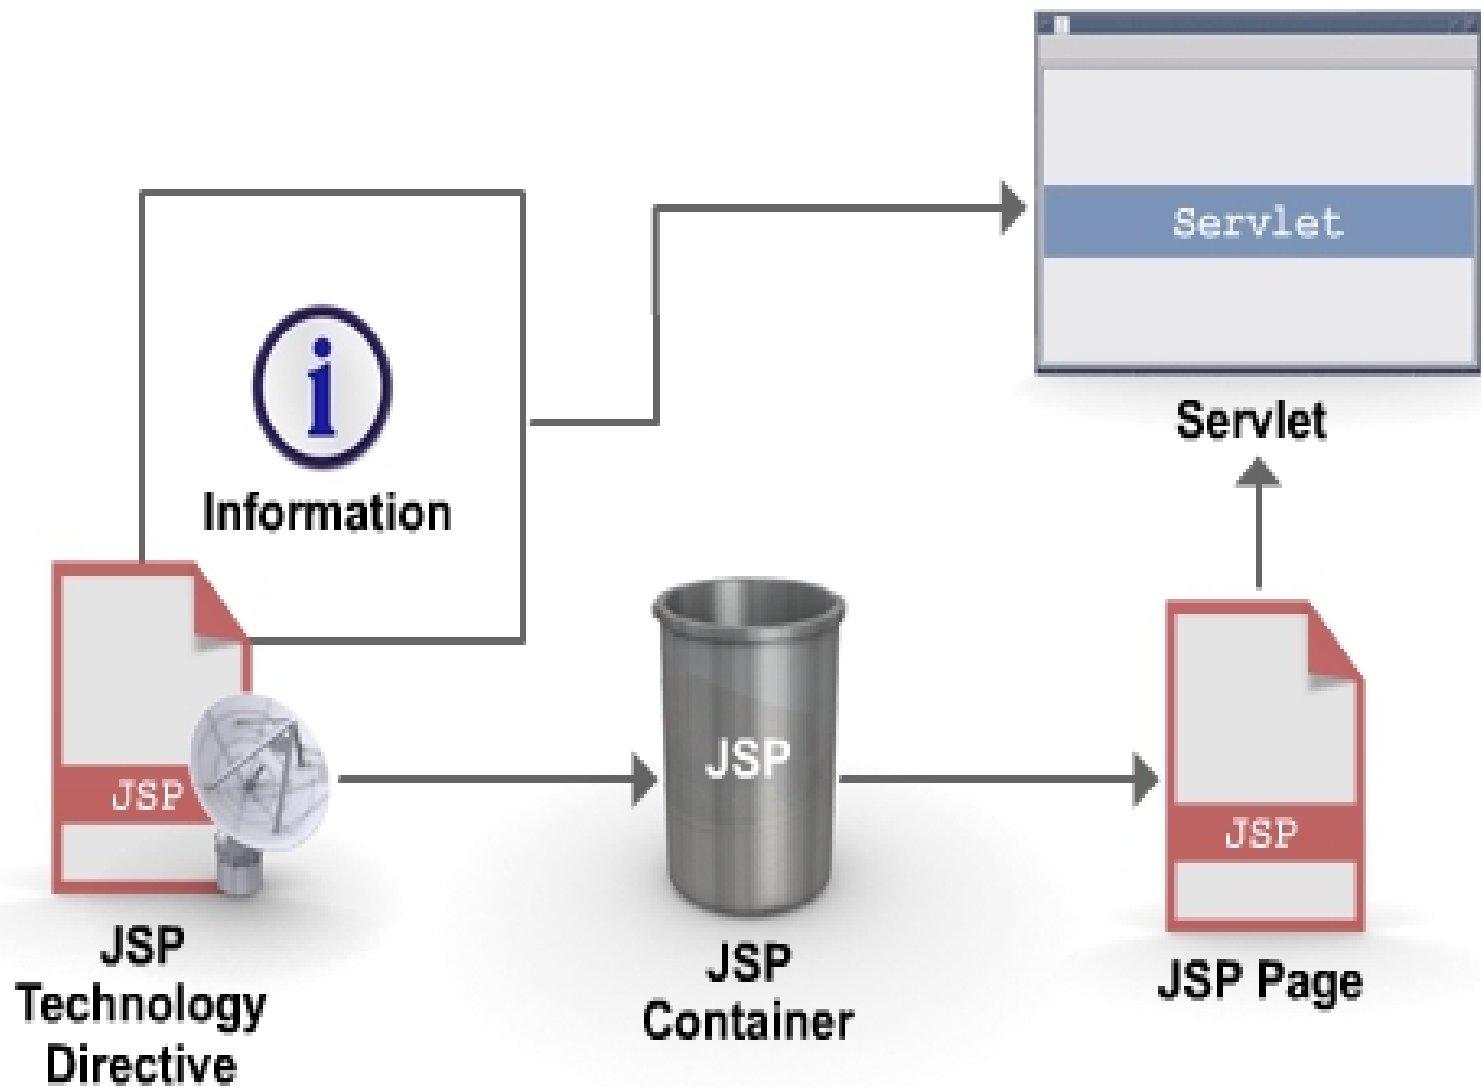

```
<jsp:include page="osnovanie.jsp" flush="true" />
```

JSP действие

```
</BODY>
```

```
</HTML>
```

JSP Technology Directives

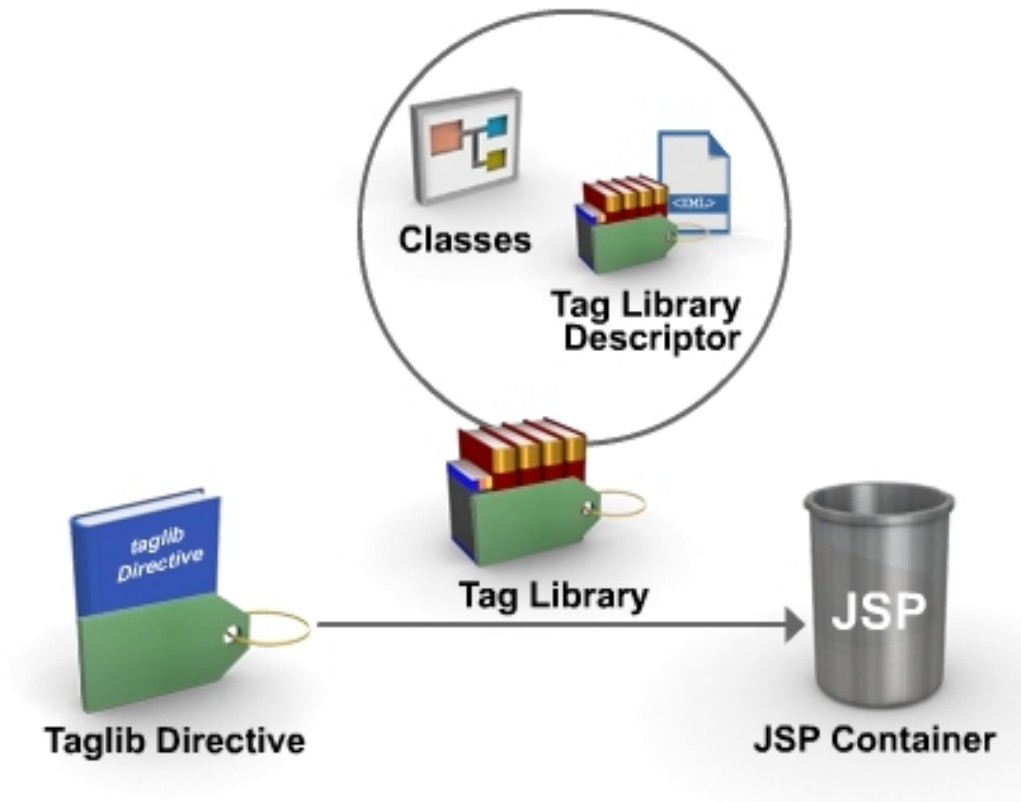

The page Directive

- A translation unit (JSP source file and any files included via the include directive) can contain more than one instance of the page directive, all the attributes will apply to the complete translation unit (i.e. page directives are position independent).
 - Exception: *pageEncoding* and *contentType* should appear at the beginning of the page
- There shall be ONLY ONE occurrence of any attribute/value pair defined by this directive in a given translation unit
 - Exception: *import* and *pageEncoding* attributes can appear multiple times

The taglib Directive

- The set of significant tags a JSP container interprets can be extended through a tag library

The taglib Directive

```
<%@ taglib uri="http://www.mycorp/supertags" prefix="super" %>
...
<super:doMagic>
...
</super:doMagic>
```

```
<%@ taglib ( uri="tagLibraryURI" | tagdir="tagDir" ) prefix="tagPrefix" %>
```

JSP actions

- `jsp: text` - Виведення тексту;
- `jsp: useBean` - Пошук або створення нового екземпляра `JavaBean`;
- `jsp: setProperty` - Встановлення властивостей `JavaBean`;
- `jsp: getProperty` - Доступ до властивостей `JavaBean` та направлення їх в потік виводу;
- `jsp: include` - Підключає файл у момент запиту сторінки;
- `jsp: forward` - Перенаправляє запит на іншу сторінку;
- `jsp: param` - Додає параметри в об'єкт запиту, наприклад в елементах `forward`, `include`, `plugin`.

```
<html>
  <head>
    <title>useBean Example</title>
  </head>
  <body>
<jsp:useBean id="date" class="java.util.Date" />
The date/time is <%= date %>
  </body>
</html>
```

```
<html>
  <head>
    <title>useBean Example</title>
  </head>
  <body>
<%
  Object temp = pageContext.findAttribute("date");
  java.util.Date tdate = null;
  if (temp != null && temp instanceof java.util.Date) {
    tdate = (java.util.Date) temp;
  }
  else {
    tdate = new java.util.Date();
  }
%>
The date/time is <%= tdate %>
  </body>
</html>
```

Servlet and JSP interaction

- In MVC model Servlet and JSP typically communicate by passing data in JavaBeans:
 1. Servlet create a JavaBean and store the bean in appropriate scope (request, session, application)
 2. Servlet forward to the JSP
- The JSP should only be called from the Servlet
- The JSP should never have to create the JavaBean itself

jsp:getProperty & jsp:setProperty

- The getProperty action
 - Provide a convenient way of invoking a get method of JavaBean
- The setProperty action
 - Provide a convenient way of invoking a set method of JavaBean
- With all three of the bean-manipulating actions, it is possible to remove majority of scripting elements

jsp:setProperty

- The setProperty action is used to set values of a bean
 - `<jsp:useBean id="myName" ... />`
 - ...
 - `<jsp:setProperty name="myName"`
 `property="someProperty"`
 `valueAttribute />`
- *valueAttribute*
 - `value="value"` – value may be a runtime value
 - `param="value"` – value can be retrieved from a request parameter

- `<jsp:directive.include file=""/>`
- `<jsp:include page="{relativeURL | <%= expression %>}" />`
 - `RequestDispatcher.include()`
- `<jsp:forward page="{relativeURL | <%= expression %>}" />`
 - `RequestDispatcher.forward()`
- `<jsp:param name="parameterName" value="{parameterValue | <%= expression %>}" />`
 - Available by `HttpServletRequest.getParameter()`

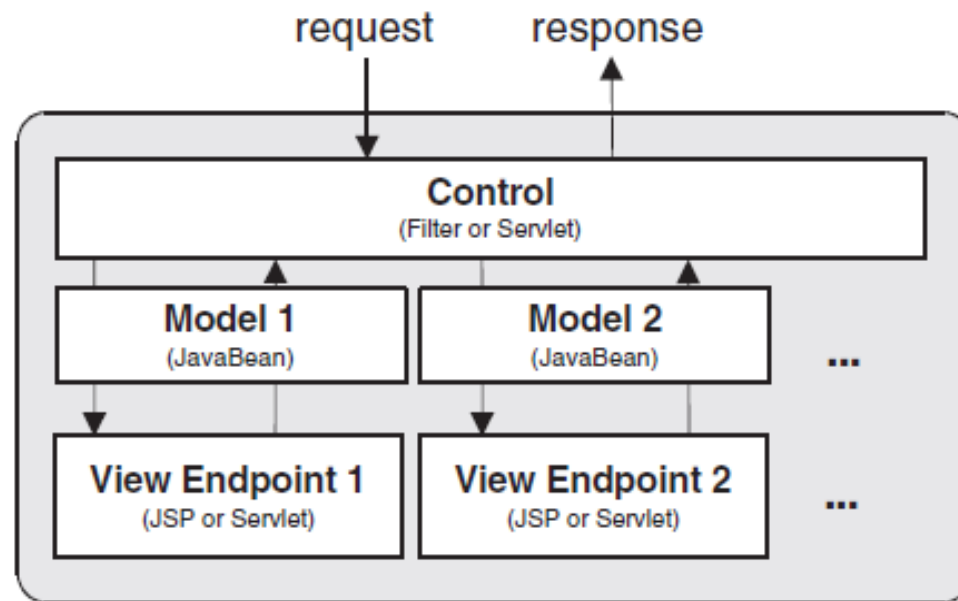

```

<jsp:forward page="examplePage.jsp">
    <jsp:param name="foo1" value="bar"/>
    <jsp:param name="foo2" value="<%= foo %>"/>
</jsp:forward>

```

JSP Property groups

- JSP group configuration
- Headers, Footers

Model 2 Web Application
